What is still needed - 1 work, 1 claim

Six works were asked for last time; five are now closed. Carlson came whole and settled the sentence it was cited for, and the books that came with it carried Cattaneo, Vernotte and Danilovskaya. **One work is left**, and the table below it names the books that would do instead - every DOI on this page was resolved against a record on 2026-11-01.

If the 1912 volume cannot be found, do not spend another order on it. Born and Huang's *Dynamical Theory of Crystal Lattices* is Born's own treatise on lattice dynamics: the monatomic chain is solved there, which is exactly the relation the sentence states. If it credits the 1912 note the attribution survives; if it does not, the clean fix is to cite the book instead of the paper. Either way one book ends the list.

Still needed from you

#	Author(s) and year, then the title	What it unblocks	DOI	ok
1	**Born and von Karman 1912** *Über Schwingungen in Raumgittern* English: On vibrations in space lattices print only - Phys. Z. 13, 297-309; no publisher record and no scan found	The exact chain dispersion relation omega = 2 sqrt(kappa_s/m) times abs(sin(ka/2)).	*none*	-

Books that would do instead of the 1912 paper

#	For	Book, and why it would do	DOI or ISBN (verified)
1	this one CR181	**Born and Huang**, *Dynamical Theory of Crystal Lattices* 1954 (Oxford; Oxford University Press online reissue dated 1996) This is Born's own treatise on lattice dynamics and the standard place where the monatomic chain is solved, which is the relation the sentence states. If it prints omega = 2 sqrt(kappa/m) abs(sin(ka/2)) and credits the 1912 note, the attribution survives; if it does not credit the 1912 note, the clean fix is to cite this book instead of the 1912 paper. Either way one book settles the last open claim.	DOI 10.1093/oso/9780192670083.001.0001; ISBN 9780192670083 and 9781383002348; the chapter 'Lattice Vibrations' is DOI 10.1093/oso/9780192670083.003.0002
2	optional CR137 (optional)	**Nowacki**, *Thermoelasticity, second edition, revised and enlarged* 1986 (PWN, Warsaw, and Pergamon Press) Only if the author prefers to keep the Nowacki citation rather than drop it: the claim no longer blocks anything, because Carlson carries the sentence, but the book is the only way to read the Nowacki attribution itself. Beware the trap already recorded - the Nowacki book of 1975 is a different title, Dynamic Problems of Thermoelasticity (Noordhoff).	ISBN 978-0-08-024767-0; the chapters carry DOIs under 10.1016/b978-0-08-024767-0
3	optional CR092 and CR093 (optional, cross-check only)	**Straughan**, *Heat Waves* 2011 (Springer, New York) An independent modern book that sets out the Cattaneo-Vernotte law and its history; worth having only if a book-length confirmation of the relaxation-term story is wanted, since both claims are already carried by sources in hand. Not needed to unblock anything.	DOI 10.1007/978-1-4614-0493-4; ISBN 9781461404927 and 9781461404934

What closed this round, in one line each. CR092 - Cattaneo (1948) is credited with the relaxation term in a 2010 Oxford monograph, which says the equation becomes a telegraph, i.e. hyperbolic, equation. CR093 - Tzou calls the relaxed law the Cattaneo-Vernotte wave model and prints the 1958 note as C. R. 246, 3154-3155. CR136 - Carlson, sect. 24 gives the variational principles (pp. 338-342); sect. 13 (p. 319) and sect. 21 (p. 331) give the reciprocal theorems. CR168 - the 2010 monograph names problems "of Danilovskaya type" and prints her 1950 paper as Prikl. Mat. Mech. 14(3), in Russian.

One claim left the list without a book arriving. CR137 cites Nowacki for the same sentence as Carlson, and Carlson carries it in full. So the Nowacki reference is now a wording decision - drop it, or supply the book - and nothing blocks the claim. Note the trap recorded earlier: the Nowacki book of 1975 is *Dynamic Problems of Thermoelasticity*, a different title from *Thermoelasticity*.

Two things that were not usable. A one-page extract of Cattaneo's 1948 note was the front page of his 1966 Varenna course, with no argument on it - it did, however, confirm the venue, Atti del Seminario Matematico e Fisico dell'Universita di Modena, vol. 3. An engineering *Heat Conduction* text has no Cattaneo and no Vernotte in it at all. Neither was counted as evidence.

Outside the list: Polizzotto (2001), Int. J. Solids Struct. 38 - the held copy has no extractable text, so claim CR195 waits for a readable copy. And four claims (CR127, CR152, CR166, CR196) are recorded as held but no readable copy could be found; they need nothing from you.

What to change in the paper - 23 items, 5 of them mandatory

Everything on this page comes from a verdict file in the repository, not from memory: a sentence is here because a source was read and it did not carry the sentence, or because a bibliography line is provably wrong. The suggested wordings are suggestions for the author; the evidence line is what has to stay true. Full sheet: PAPER_EDIT_SHEET in the same folder.

I001 CR133 CR134 - sentence as written:
For DPL and TPL (first-order truncations) an energy functional exists but its construction is more involved than for the other members of the template (Quintanilla 2003; Chirita 2016).
Wrong because: Both citations attached to this sentence fail on the one thing it asserts - that an energy functional exists. Quintanilla (2003) proves exponential stability for tau_y > tau_q/2 and instability below it (abstract, p.713); it does not construct an energy functional. Chirita, D'Apice and Zampoli (2016) treat the three-phase-lag model through fading memory and thermodynamic restrictions and construct no functional eithe
Do this: Either attach a paper that actually builds the functional for DPL and TPL, or rewrite the sentence to the claim the two citations do carry (a stability threshold), and drop the functional clause.
Suggested wording: *For DPL and TPL the question that has been settled is stability, not the functional: the one-dimensional dual-phase-lag problem is exponentially stable for tau_y > tau_q/2 and unstable below it (Quintanilla 2003), and the three-phase-lag model is covered by fading-memory arguments (Chirita, D'Apice and Zampoli 2016).*

I002 CR200 - sentence as written:
The one-dimensional piezoelectric bar in the quasi-electrostatic approximation follows Yang (2018) and Mindlin and Tiersten (1962).
Wrong because: Mindlin and Tiersten (1962) is a couple-stress theory of linear elasticity: no electric field, no piezoelectric coupling, no quasi-electrostatic bar. A full-text search of all 34 pages returns nothing that could carry the sentence. The other half of the sentence (Yang 2018) is held but its chapter has not been read yet.
Do this: Drop Mindlin and Tiersten from this sentence - they belong in the couple-stress discussion, not here - and keep Yang (2018), whose chapter still has to be read.
Suggested wording: *The one-dimensional piezoelectric bar in the quasi-electrostatic approximation follows Yang (2018).*

I003 CR087 CR083 - sentence as written:
For a law with memory the second law restricts the relaxation function and the entropy flux, not only the signs of the coefficients (Coleman and Gurtin 1967; Chen and Nunziato 1974).
Wrong because: Coleman and Gurtin (1967) treats materials with internal state variables whose evolution obeys ordinary differential equations, and the second law enters as the Clausius-Duhem inequality (3.2) restricting response functions. It does not state that the second law restricts the relaxation function and the entropy flux. The companion citation, Chen and Nunziato (1974), could not be found in two Crossref queries at all.
Do this: Rewrite the sentence to what Coleman and Gurtin actually do (state variables, Clausius-Duhem), or produce the page that states the relaxation-function restriction. For Chen and Nunziato 1974, do a catalogue lookup - no DOI may be printed for it. The Chen and Nunziato 1974 citation itself is item I018.
Suggested wording: *For a law with memory the second law enters through the Clausius-Duhem inequality and restricts the response functions of the material, not only the signs of its coefficients (Coleman and Gurtin 1967).*

I004 CR062 - sentence as written:
Further variants (fractional DPL and TPL, with fractional orders on one or both sides of the lag equation) are numerous; reviews and critical discussions of the logic of fractional thermoelasticity are given in [Povstenko2016, Yu2024, Gorenflo1997, Povstenko2004, Povstenko2007, Povstenko2009].
Wrong because: The sentence is about fractional thermoelasticity but one of its two supports, Gorenflo and Mainardi (1997), is a fractional-calculus text: its abstract lists Riemann-Liouville calculus, the Laplace-transform technique, Abel integral equations and relaxation and oscillation equations - nothing on thermoelasticity. The other support, Povstenko (2015), is the right book but the phrase 'three-phase-lag' does not appear
Do this: Either cite a fractional-thermoelasticity review that discusses DPL and TPL together, or split the sentence: keep the fractional variants on Povstenko and drop the TPL grouping.
Suggested wording: *Further variants (fractional DPL and TPL, with fractional orders on one or both sides of the lag equation) are numerous; the fractional ones are reviewed by Povstenko (2015).*

I023 CR209 CR210 CR177 CR050 - sentence as written:
Rayleigh-type waves in a nonlocal micropolar thermoelastic half-space containing void pores were computed by Kumar and Tomar (2024); temperature-rate-dependent thermoelasticity with memory-dependent derivative, including energy and uniqueness theorems, was developed by Singh et al. (2020). || Energy ratios have been computed for fluid-piezothermoelastic and fluid-double-porous interfaces (Gupta et al. 2023; Kumar and
Wrong because: The author declared these four citations unimportant on 2026-11-01, so no evidence will be produced for them - and a sentence cannot rest on a source that will not be shown.
Do this: Remove the four citations and rewrite the two sentences so that nothing depends on them; the works are listed in waived_by_author_2026-11-01.csv with the wording that has to change.
Suggested wording: *(author's call - the sentences have to lose these names, not gain replacements)*

The rest, in one line each. 5 further sentences need a clause softened or a citation re-pointed (CR060, CR182 CR184, CR172, CR188, CR137); 9 bibliography lines are wrong or incomplete and carry a verified fix (I010 CR136, I011 CR092, I012 CR117, I013 CR003 CR114, I014 CR110, I015 CR154, I016 CR126, I017 CR122, I018 CR083); 4 items wait on a copy and need no decision today (CR181, CR127 CR152 CR166 CR196, CR195, CR199).

Two bibliography lines worth checking twice. The DOI recorded for van der Merwe, van Rensburg and Sieberhagen resolves to a graph-theory article - the correct one is 10.1016/j.amc.2020.125934 - and the Carlson chapter is dated 1973 by its record, not 1972. Chen and Nunziato (1974) could not be found in two catalogues lookups, so no DOI is printed for it anywhere.
